

Ratko G. Veprek

Computational Modeling of Semiconductor Nanostructures for Optoelectronics

2009, XIV, 226 pages, € 64,00. ISBN 3-86628-286-9 978-3-86628-286-5

Contents

Acknowledgements	i
Abstract	iii
Zusammenfassung	v
1 Introduction	1
1.1 Motivation	1
1.2 Computational Modeling	2
1.3 Continuum Approach	3
1.4 Contents	4
2 Static Properties of Nanostructures	7
2.1 Introduction	7
2.2 Crystals	9
2.2.1 Zinc-blende	9
2.2.2 Wurtzite	9
2.3 Misfit Strain	11
2.3.1 Introduction	11
2.3.2 Theory of Linear Strain	12
2.3.3 Elastic Coefficients in Cubic Crystals	14
2.3.4 Elastic Coefficients in Wurtzite Crystals	15
2.3.5 Intrinsic Strains	16
2.3.6 Finite Element Discretization	19
2.4 Spontaneous and Piezoelectric Polarization	23
2.4.1 Introduction	23
2.4.2 Direct Piezoelectric Effect	25
2.4.3 Piezoelectric Fields	27
2.4.4 Finite Element Discretization	29
2.5 Summary	35
3 Electronic States in Nanostructures	37
3.1 Introduction	37
3.2 Crystal Schrödinger Equation	38
3.2.1 Introduction	38
3.2.2 Bloch Theorem	41
3.2.3 The k·p Method	42
3.3 The k·p Envelope Function Method	50
3.3.1 Introduction	50
3.3.2 Traditional k·p Envelope Function Ansatz	51
3.3.3 Exact Envelope Function Method	53
3.3.4 Operator Ordering	56
3.3.5 Quantum Wells and Quantum Wires	59
3.3.6 Zinc-blende Models	59

3.3.7 Wurtzite Models	69
3.4 Ellipticity and Operator Ordering	73
3.4.1 Introduction	73
3.4.2 Spurious Solutions	76
3.4.3 Derivation of Criteria for the Ellipticity	80
3.4.4 Zinc-Blende	83
3.4.5 Wurtzite	89
3.4.6 Discussion	93
3.4.7 Summary	95
3.5 Strained Nanostructures	96
3.5.1 Introduction	96
3.5.2 Zinc-Blende Deformation Potentials	98
3.5.3 Wurtzite Deformation Potentials	99
3.6 Finite Element Discretization	100
3.6.1 Introduction	100
3.6.2 $k \cdot p$ Matrix Rotations	101
3.6.3 Variational Formulation	102
3.7 Summary	104
4 Classical Optical Transitions of Free Carriers	105
4.1 Introduction	105
4.2 Second Quantization	107
4.2.1 Preliminary Considerations	107
4.2.2 Transformation into Bloch States	111
4.2.3 Uncorrelated Hamiltonian in Bloch Basis	116
4.2.4 Introducing Holes	116
4.2.5 Carrier statistics	117
4.3 Calculating Transitions	119
4.3.1 Introduction	119
4.3.2 Quantum-Kinetic Microscopic Polarization	121
4.3.3 Heisenberg Equation of Motion	122
4.3.4 Solving the Free Carrier Equation	124
4.4 Spontaneous Emission	125
4.5 Matrix Elements	127
5 Classical Coulomb-Correlated Optical Transitions	131
5.1 Introduction	131
5.2 Second Quantization	132
5.2.1 Introduction	132
5.2.2 Diagonal Approximation	136
5.2.3 Introducing Holes	136
5.3 Calculating Transitions	138
5.3.1 Heisenberg Equation of Motion	138
5.3.2 Hartree-Fock Approximation	140
5.3.3 Screening	141
5.3.4 Solving the Correlated Equation	144
5.4 Numerical Evaluation	145
5.4.1 Introduction	145
5.4.2 Coulomb Integrals	146
5.4.3 Microscopic Polarization	148

5.4.4 Lindhard Screening	151
5.4.5 Screened Exchange Shifts	152
6 Numerical Implementation	155
6.1 Introduction	155
6.2 Finite Elements	156
6.2.1 Introduction	156
6.2.2 Elements	158
6.2.3 Nodal Basis	159
6.3 Eigenvalue Solvers	159
6.3.1 Arnoldi	160
6.3.2 Jacobi-Davidson	161
6.4 Basic Software Design	163
6.4.1 Overview	163
6.4.2 Core Description	163
7 Applications	167
7.1 AQUA	167
7.2 Quantization in Nanostructures	168
7.3 GaN Nanocolumns	177
7.3.1 Introduction	177
7.3.2 Model Description	179
7.3.3 Strain Analysis	181
7.3.4 Size and Composition Dependencies	183
7.3.5 Analysis of Dot-like States	186
7.3.6 Discussion and Conclusions	192
8 Conclusions	195
8.1 Major Achievements	195
8.2 Future Work	196
A Finite Elements	199
A.1 Elements in 1D	199
A.2 Elements in 2D	200
CONTENTS	xiii
A.2.1 Triangle	200
A.2.2 Rectangle	200
A.3 Elements in 3D	202
B List of publications	205
Bibliography	209
Curriculum Vitae	225
